

(re)collections:

developing a metadata application profile for the Quinkan Culture Matchbox

Thesis submitted by

Sophie LISSONNET

(M. Bus. I. T (Information Management), RMIT University, 2002)

in July 2004

for the degree of Masters of Indigenous Studies

in the School of Indigenous Australian Studies

James Cook University

APPROVALS

ACKNOWLEDGEMENTS

The researcher wishes to thank the residents of Laura and surrounds for their support, hospitality and for sharing their knowledge and affection for Quinkan Country.

Team mates, staff and friends at James Cook University (SIAS) and La Trobe University (CS & CE) are also acknowledged with gratitude. Thanks must be extended to the institutions that have provided advice and support.

This research was supported by an ARC Linkage Grant (C00107679) and an Australian Postgraduate Award (Industry).

ABSTRACT

The Quinkan community has chosen to use online technology to repatriate some of the widely dispersed content that forms part of its culture. Metadata about resources can be aggregated without the need to aggregate resources. Dublin Core (qualified), with its focus of resource discovery, has been chosen as one of the building blocks of the ‘virtual cultural institution’, the Quinkan Matchbox. Some of the resources to be repatriated are not yet identified. Others have been described according to a great variety of guidelines or to suit a variety of purposes. This research takes advantage of the modularity and extensibility of the Dublin Core architecture to develop a unifying metadata application profile (MAP) to describe the content of the Quinkan Matchbox. The profile must support the importation of records produced by a variety of intellectual communities with tolerable levels of loss. It must also reflect the Quinkan community’s view of cultural heritage, possibly through the addition of local usage elements, element refinements and vocabularies.

The building of the Quinkan Matchbox is informed by the differing Western and Indigenous views on heritage. It places the preservation of Indigenous heritage through online networks and multi-media technology in the context of cultural globalisation, control over intellectual property and traditional modes of transmission of cultural knowledge. The design of a composite profile follows the Aggregation, Rationalisation, Harmonisation (ARH) framework (Currie et al., 2002). Following a review of a number of metadata standards used in the cultural heritage community, the draft application profile is assembled by aggregating, then rationalising metadata elements from Dublin Core with elements from other metadata element sets. Cataloguing of existing resources

is used to test the MAP's ability to accommodate the cataloguing practices of organisations holdings records of interest to the Quinkan community and to adjust the design of the profile in order to minimise loss or distortion. It is suggested that specialised, more granular MAPs could be developed to support specific purposes. The lack of insider's knowledge of the culture profiled makes it difficult to evaluate whether the local refinements and vocabularies introduced reflects the contours and relief of the Quinkan cultural landscape. In the end, the MAP is to be regarded as one component of a large assembly of technical infrastructure, legal agreements and human resources that still remain to be built, validated and staffed. The relevance and usefulness of the Quinkan Matchbox as a cultural tool will be fully realised if it can be woven into cultural practices and assist the community in affirming its sense of identity.

USAGE AND SPELLING

Rock Art: the usage of upper case follows the lead of N. Cole, who has studied extensively the Rock Art of Quinkan Country.

Schemata: the plural form of the term 'schema' is 'schemata'. It has been adopted throughout this thesis, with the exception of direct quotes using the term 'schemas' that have been kept unchanged.

The Web: The complete set of documents residing on all Internet servers that use the HTTP protocol, accessible to users via a simple point-and-click system¹.
