IDENTIFICATION OF NOVEL MODIFIERS OF CHROMOSOME INHERITANCE

USING A GENETICALLY SENSITISED DROSOPHILA MODEL

Thesis submitted by

Sally M HUNTER, B.Biomed Sci

for the degree of Doctor of Philosophy
in the School of Pharmacy and Molecular Sciences, James Cook University

STATEMENT OF ACCESS

I, the undersigned, author of this work, understand that James Cook University will make this thesis available for use within the University Library and, via the Australian Digital Theses network, for use elsewhere.

I understand that, as an unpublished work, a thesis has significant protection under the Copyright Act and I do not wish to place any further restriction on access to this.

STATEMENT OF THE CONTRIBUTION OF OTHERS

Stipend Support: This research was performed with the assistance of an Australian Postgraduate Award stipend.

Supervision: This research was performed under the supervision of Dr. W. Warren in the School of Pharmacy and Molecular Sciences, at James Cook University, Townsville.

Editorial Assistance: Drs. W. Warren and S. L. Page kindly assisted in the editorial process.

Research Assistance: The neuroblast squash experiment presented in Chapter 3, section 3.2.4 was established in close collaboration with Dr. S. L. Page. The final data and images presented in this thesis were generated and collated by Dr. S. L. Page.

Sputter coating of *Drosophila* samples to be analysed by Scanning Electron Microscopy was performed by Dr. Kevin Blake, Steven Croft and Dr. Shane Askew.

DNA microinjections into *Drosophila* embryos were performed by Dr. W Warren.

General fly keeping was carried out by Cameron Hunter and a number of other assistants over the three and a half year period of this study.

Any Other Assistance: DNA sequence analysis was performed by Macrogen Inc, Korea

Project Costs: This work was supported by the NHMRC through the Australian *Drosophila* Biomedical Research Support Facility at the ANU and by funding from the March of Dimes Foundation.

ACKNOWLEDGEMENTS

I would first and foremost like to thank my supervisor Assoc. Prof. Bill Warren and my co-supervisor Prof. Alan Baxter for their constant support throughout my PhD candidature. Their knowledge on subjects within and without science has been extremely helpful throughout the past 4 years. Their trust in my judgement is greatly appreciated and I hope I have done them proud. I would particularly like to thank Bill for all the opportunities he has brought to me, particularly allowing and encouraging me to attend conferences that extended my knowledge, horizons and scientist network.

I would also like to extend a very big thankyou to other members of the lab over the period of my PhD. Rebecca Keall and Rachael Rutkowski were there in the beginning and gave me a good grounding in fly genetics. I continue to value the friendship that these women extended to me. Jacob Goodwin, an honours student in 2005, was always good for my sense of humour and also became a valued friend. And finally Bernhard Waltenspiel has been a fantastic colleague, as a fellow PhD student he has been very supportive and encouraging during tough times.

Scott Page, post doc extraordinaire, gets a paragraph all to himself. I would like to take this opportunity to extend my thanks to Scott who has been incredibly supportive over the two and half years that we have worked together. With Scott's extensive knowledge of *Drosophila* genetics and science generally, his decorum and constant willingness to help, he has been an inspiring role model, a fantastic colleague and a great friend. Having a brain-storming partner has made the world of difference to this project and my development as a scientist.

Other members of the JCU Molecular Sciences community that rate a mention are the honourable Jayden Smith, Veronica Graham, Hayley Gallagher, Grant Stuchbury and Ursula Tems. These people have been fantastic friends to me over many years, through the good times and the bad. I cannot thank them enough for all the fun and friendship they have brought into my life. I don't think I could have made it through my PhD without such reliable friends as these.

I would also like to thank the Heads of School, David Yellowlees and Michael Ridd, who held the role during my candidature. Both of these men are truly inspiring role models not only in their conduct, but their extraordinary ability to always summon a friendly smile. I have come to realise that a supportive HOS is truly invaluable.

My family has been unbelievably supportive throughout my university degrees and for that I will always be grateful. Mum and dad, having given everything to make sure we could be whatever we wanted I hope we have made you proud. Thankyou to everyone for your friendship, support and unconditional love. A huge thankyou to Tyson, who has been unbelievably supportive and has kept me sane through the writing process.

A final thanks to all the previously unmentioned friends and colleagues who have been part of my life for the past 4+ years. All good things must come to an end.

ABSTRACT

Loss of chromosome cohesion has been implicated as a significant contributor to chromosome missegregation and aneuploidy. A central and essential figure mediating chromosome cohesion is the cohesin complex. This multi-subunit protein is conserved in all eukaryotes studied and related proteins are also present in bacteria. Reduction of cohesin subunits and cohesin regulators has been conclusively demonstrated to perturb normal chromosome cohesion and segregation. Cohesin not only has a central role in maintaining cohesion between sister-chromatids between S phase and the onset of anaphase in both mitosis and meiosis. The cohesin complex is also essential in the formation and maintenance of chiasmata between homologous chromosomes during meiosis.

The study presented in this thesis aimed to identify regulators of chromosome cohesion and segregation by employing a genetic screening approach using a modified cohesin subunit (*Rad21^{NC}*) that perturbs chromosome segregation by impeding chromosome separation at anaphase. At the commencement of this study it was clear that much of the molecular network underlying chromosome segregation remained to be determined and that metazoan species, such as *Drosophila*, could provide unique insights into these processes. The aim of this study was to identify novel regulators of chromosome cohesion and segregation. To achieve this, a chromosome missegregation model was used that employed a non-cleavable form of the cohesin component *Rad21* to impede chromosome segregation. When ectopically expressed in the replicating cells of the developing *Drosophila* eye this cleavage-resistant variant produced a reduced and disorganised eye phenotype. The underlying cellular phenotype demonstrated increased levels of tetraploidy, aneuploidy, lagging chromosomes and fragments of broken chromosomes. This eye phenotype proved modifiable by second site heterozygous mutations in genes encoding known regulators of cohesin and chromosome segregation, such as *NippedB*, *Separase* and *Cyclin B*. Following this characterisation the chromosome missegregation phenotype was utilised as a screening tool to identify regulators of chromosome segregation capable of modifying chromosome cohesion. The genetic screen performed as part of this study identified 133 candidate loci that were able to modify the *GMR>Rad21^{NC}* chromosome missegregation model and thereby have

been linked to chromosome segregation. The screen was carried out using mutant alleles of loci that fell within the breakpoints of deletions previously identified as *GMR>Rad21^{NC}* modifiers. The number of modifying loci is greater than originally anticipated, however, this may reflect the molecular complexity of chromosome segregation, the inter-connectedness of cellular pathways and the multi-functional nature of proteins.

The presence of RAD21^{NC} cohesin complexes on chromosomes has a detrimental effect on the cell following the onset of anaphase. The direct effects of the expression of *Rad21^{NC}* on chromosome segregation were visualised using neuroblast chromosomes, with a significant number of tetraploid and aneuploid cells observed, as well as lagging and broken chromosomes. Impeding chromosome segregation during *Drosophila* eye development was shown to cause significant levels of cell death and altered cell cycle progression, producing a disorganised (rough) and reduced adult eye. This *GMR>Rad21^{NC}* rough-eye phenotype was employed to perform a genome-wide screen for second site modifier loci capable of either suppressing or enhancing the RAD21^{NC} eye phenotype. The genetic screen identified 133 individual modifier loci as candidate chromosome cohesion and segregation regulators. In-depth analyses of published studies revealed that many of the loci identified had established links to cohesin, chromosome segregation, mitosis and meiosis, indicating that the screen had successfully identified regulators of chromosome cohesion and segregation. However, several of these loci had not previously been implicated in chromosome cohesion and segregation and are very interesting for further investigation as novel regulators of these processes.

LIST OF ABBREVIATIONS

aa	Amino acid
BL	US <i>Drosophila</i> stock centre at Bloomington, Indiana
bp	Base Pair
BSA	Bovine serum albumin
CDK	Cyclin-dependent kinase
cDNA	DNA that has been synthesized from a messenger RNA template
CO₂	Carbon dioxide
Df	Deficiency
ddH₂O	Double-distilled water
DNA	Deoxyribonucleic Acid
DTT	Dithiothreitol
ECL	Enhanced chemi-luminescence
EDTA	Ethylenediaminetetraacetic acid
G₀	Parental generation
G₁	First generation
G₂	Second generation
GMR>	GMR-Gal4 induced transgene expression
kb	Kilobase
kDa	Kilodalton
LB	Luria Bertani media
MI	Meiosis I – first meiotic division
MII	Meiosis II – second meiotic division
MF	Morphogenetic furrow
mRNA	Messenger ribonucleic acid
NaCl	Sodium chloride
NaOH	Sodium hydroxide
ND	Non-disjunction
PBS	Phosphate buffered saline
PBT	Phosphate buffered saline with 0.1% Tween-20
PCR	Polymerase chain reaction
PD	Precocious division (of chromosomes)
RNA	Ribonucleic acid
rpm	Revolutions per minute
SAC	Spindle assembly checkpoint
SAP	Shrimp alkaline phosphatase
SB	Squishing buffer
SDS	Sodium dodecylsulphate
SMC	Structural maintenance of chromosomes
TAE	Tris-acetate-EDTA
Tris-Cl	Tris-chloride
TE	Tris-EDTA
UAS	Upstream activation sequence
