

Guiding Linear Deductions with Semantics

Thesis submitted by
Marianne Elizabeth Brown BSc(Hons) *JCU*
December 2003

for the Degree of Master of Science
in the School of Information Technology
James Cook University

Statement on Access

I, the under-signed, the author of this work, understand that James Cook University will make this thesis available for use within the University Library and, via the Australian Digital Theses network, for use elsewhere.

I understand that, as an unpublished work, a thesis has significant protection under the Copyright Act and I do not wish to place any restriction on access to this thesis.

Declaration

I declare that this thesis is my own work and has not been submitted in any form for another degree or diploma at any university or other institution of tertiary education. Information derived from the published or unpublished work of others has been acknowledged in the text and a list of references is given.

Signature

Date

Electronic Copy

I, the undersigned, the author of this work, declare that the electronic copy of this thesis provided to the James Cook University Library is an accurate copy of the print thesis submitted, within the limits of the technology available.

Acknowledgements

I would like to thank Dr. Geoff Sutcliffe, who was my supervisor for the first three years, and Dr. Bruce Litow, who was my supervisor for the last three years. This thesis would not have been finished without their support. I would like to also acknowledge the support and motivation provided by the staff at the School of Information Technology including Dr. Greg Allen and Mrs. Beverley Frangos. To my fellow research students Alan McCabe, Chris Christensen and Jarrod Trevathan, thanks for the coffee and conversations. And finally to family and friends, who for the most part, tried to avoid the inevitable question, “So, how’s the thesis going?”

Abstract

Guidance is a central issue in Automatic Theorem Proving systems due to the enormity of the search space that these systems navigate. Semantic guidance uses semantic information to direct the path an ATP system takes through the search space. The use of semantic information is potentially more powerful than syntactic information for guidance. This research aimed to discover a method for incorporating semantic guidance into linear deduction systems, in particular model elimination based linear systems. This has been achieved. The GLiDeS pruning strategy is a simple strategy of restricting the model elimination deduction to one where all A-literals are false in the guiding model. This can be easily incorporated into any model elimination based prover. Evaluation of the GLiDeS strategy has shown that when “good guidance” has been achieved, the benefit of this guidance is significant. However attempts to develop a heuristic for predicting which model will provide “good guidance” has been largely unsuccessful.

Original Contributions

1. Developed novel strategy (GLiDeS) for applying semantic guidance to full linear deduction systems.
2. Shown that the new GLiDeS strategy is sound but incomplete.
3. Shown that GLiDeS is complete for a small group of problems termed *Semantic Horn* and that this result is essentially equivalent to renaming [Slagle, 1967].
4. Implemented system to demonstrate ease of including GLiDeS into an existing linear theorem proving system, PTPP.
5. Evaluated performance of the GLiDeS semantic guidance strategy and concluded that overall the GLiDeS strategy does not provide significant improvement to PTPP's performance.
6. It has been shown that when good guidance is achieved the improvement in performance is significant. GLiDeS dramatically reduces the amount of search space covered before a proof is found (as reflected by the number of inferences made). In the best case, PTPP covered on average 8 times the search space that GLiDeS covered (See NHN_SEQ Table 6.7).
