**Phylogeny and evolutionary history of Sapindaceae and *Dodonaea***

**Thesis submitted by**

**Mark Gerard Harrington BSc (Hons) JCU**

**in May 2008**

**for the degree of Doctor of Philosophy**

**in the School of Marine & Tropical Biology**

**James Cook University**

## **STATEMENT OF ACCESS**

I, the undersigned, author of this work, understand that James Cook University will make this thesis available for use within the University Library and, via the Australian Digital Theses network, for use elsewhere.

I understand that, as an unpublished work, a thesis has significant protection under the Copyright Act and;

I do not wish to place any further restriction on access to this work.

## **STATEMENT OF SOURCES**

## **DECLARATION**

I declare that this thesis is my own work and has not been submitted in any form for another degree or diploma at any university or other institution of tertiary education. Information derived from the published or unpublished work of others has been acknowledged in the text and a list of references is given.

## **STATEMENT ON THE CONTRIBUTION OF OTHERS**

This project was funded with grants from the Australian Biological Resources Study, the Cooperative Research Centre for Tropical Rainforest Ecology and Management (Rainforest CRC) and James Cook University (JCU). I was supported by a Australian Postgraduate Award stipend and a completion scholarship from JCU.

Supervision was provided by Prof. Paul Gadek and Dr. Will Edwards (JCU) with editorial assistance from Christopher Quinn, Honorary Research Associate, Botanic Gardens Trust, Sydney.

## Acknowledgements

I would like to thank my supervisors Prof. Paul Gadek and Dr. Will Edwards, and Dr. Judy West from the Australian National Herbarium, Christopher Quinn, and Ed Biffin from Adelaide University for further discussions and assistance.

I acknowledge Lynne Jones and Mathew Pye for advice on molecular techniques.

I extend my thanks to Peter Raven for exhorting his many friends to help get plant samples for this project. I thank the following people and institutions from around the world for supplying plant material – Chris Birkinshaw, George Yatskievych and Gregory Gust Missouri Botanical Garden and DNA Bank, Herbarium, Dr. Victor Barradas University National avtonoma of Mexico, Dr. Brinsley Burbidge St. George Village Botanical Garden, St. Croix Virgin Islands, Suhua shi, Sun Yat-sen University, Guangzhou, Cassius Kayombo National Herbarium of Tanzania, Pedro Acevedo United States National Herbarium, Smithsonian Institution, National Tropical Botanical Garden, Kauai, Hawaii, F. Billiet Living Plant Collections, National Botanic Garden of Belgium, Botanic Garden, University of Copenhagen, Dr. Jenny Xiang, North Carolina State University, Tony Roberts. Mary Gandini, Stuart Worboys, James Cook University, Judy West, Kirsten Cowley, Lyn Craven and Ed Biffin Centre for Plant Biodiversity Research, Australian National Herbarium (CANB), Australian National Botanic Gardens living collection, Darren Crayn, Royal Botanical Gardens Sydney, Dr. Shyam Phartyal Forest Research Institute India, Cassius Kayombo National Herbarium of Tanzania, Amanda Shade Botanic Gardens and Parks Authority Perth Western Australia, Chien-I Huang, Royal Botanic Gardens Edinburgh, F. Billiet Living Plant Collections, National Botanic Garden of Belgium, Ching I Peng, Research Centre for Biodiversity Academia Sinica, Taipei, Taiwan and Christine Stucley; and DNA samples – Shelly James Pacific Centre for Molecular Biodiversity, Bishop Museum, Hawaii Kew Botanical Gardens – DNA Bank, Dr. Clifford Morden Hawaii Plant DNA Library.

Finally, I can now get back to painting the house.

## ABSTRACT

The Sapindaceae (soapberry family) is a large family of trees, shrubs and lianas comprising 133 genera (49 monotypic) and ca.1450 species, most with a tropical to subtropical distribution. The circumscription of Sapindaceae has varied, particularly with regard to inclusion of genera from the closely related, predominantly temperate families Aceraceae and Hippocastanaceae. Sequence data from two plastid genes, analysed separately and together using parsimony and Bayesian analysis support a broadly defined Sapindaceae incorporating Aceraceae, Hippocastanaceae and *Xanthoceras*. A division into four subfamilies is proposed: Sapindoideae, Hippocastanoideae, Dodonaeoideae, and Xanthoceroideae. Tribal groupings are critically evaluated in light of the analyses.

The evolutionary history of Sapindaceae is evaluated using a variety of Bayesian relaxed clock molecular estimates of divergence times, which either incorporate the dates implied by the fossil record, fossil constraints from outside Sapindaceae, and no fossil constraints. Analyses with fossil constraints from outside Sapindaceae imply a Pliocene-Miocene (6-28 Mya) origin for *Acer* and *Aesculus* rather than a Paleocene (ca 64 Mya) origin implied by the earliest attributed fossils of these genera, and an evolutionary rate for *Acer* and *Aesculus* consistent with the majority of other genera of Sapindaceae sampled. Including the fossil dated Paleocene origin of *Acer* and *Aesculus* as hard bound priors and using four constraints from outside Sapindaceae result in a potentially biologically implausible rapid change in the mean evolutionary rate on the stem branch leading to the split between *Acer* and *Aesculus* and their respective sister genera. These conflicting scenarios suggest the need for a substantial re-evaluation of our understanding of the tempo and mode of evolution of these lineages.

Intergeneric relationships within Dodonaeoideae, Hippocastanoideae and Xanthoceroideae were also assessed by firstly, generating secondary structure predictions for ITS and partial ETS sequences, and then using these predictions to assist alignment of the sequences. Secondly, the alignment was analysed using RNA specific models of sequence evolution that account for the variation in nucleotide evolution in the independent loops and covariating stems regions of the ribosomal spacers. The

phylogeny drawn from the analyses was compared with that from analyses using ‘traditional’ 4-state models and the plastid analyses.

To further our understanding of the origins of the Australian flora, and in particular plant adaptation and evolution in increasingly arid environments, the phylogeny and evolutionary history of Hopbushes (*Dodonaea* – Sapindaceae) and Pepperflowers (*Diplopeltis* – Sapindaceae) were evaluated based on nuclear ITS and partial ETS sequences and models of nucleotide evolution that incorporate secondary structure. The tempo and mode of evolution of these sister genera were evaluated using Bayesian relaxed clock molecular estimates of divergence times, Bayesian relative rates test, lineage through time plots and estimations of diversification rates (speciation minus extinction). The dry and temperate adapted genera of Sapindaceae (*Diplopeltis* species and *Dodonaea* including *Distichostemon* species) are relatively recent radiations in the Australian flora, and are most likely to be in response to increased aridity and seasonality from the late Miocene 14 Mya to Recent. There is evidence of long distance dispersal from northern Australia to Madagascar in the early Pliocene.

The cosmopolitan, polymorphic species *Dodonaea viscosa* (hop bush, varnish tree) has been the subject of taxonomic and ecological enquiry for over 150 years. ITS and partial ETS sequences for 50 samples from across its worldwide distribution were used to evaluate the evolutionary and biogeographic history of this species complex. *Dodonaea viscosa* is not an old lineage as has often been speculated based primarily on its vast distribution, but diverged from its most recent common ancestor and subsequently dispersed around the world within the last two million years. Results also indicate that there are at least two evolutionary lineages within *D. viscosa*.

## Table of contents

<b>Chapter 1: Introduction .....</b>	1
<b>Chapter 2: Phylogenetic inference in Sapindaceae sensu lato using plastid matK and rbcL DNA sequences .....</b>	4
